

## **Case Reports**

### **Non-compaction Cardiomyopathy: Two Case Reports and Update**

Jorge V. Araque Rivadeneira, Fernando L. Hidalgo

This disease is generally referred to as non-compaction of the left ventricular myocardium or isolated left ventricular non-compaction. It has been recently described as a primary genetic cardiomyopathy. Although it was previously considered a rare disorder, this diagnosis currently is more frequent. Non-compaction of the ventricular myocardium represents an arrest in the normal process of myocardial compaction in the embryo that occurs more frequently in men.

We report two cases of non-compaction cardiomyopathy diagnosed at the Hospital Eugenio Espejo in Quito, Ecuador, and perform an updated review of the disease.
